APPENDIX

Estimates of sampling errors	161
------------------------------	-----

* Table 27 is not shown because of the small number of cases and Table 50 is not shown as previous NFHS surveys did not include estimates for the new state of Andhra Pradesh.

INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires-household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on woman's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and woman's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected

with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Andhra Pradesh was conducted in all 13 districts of the state from 6 May to 4 August 2015 by the GFK Mode Private Limited and collected information from 10,265 households, 10,428 women age 15-49 (including 1,757 women interviewed in PSUs in the state module), and 1,541 men age 15-54. Survey response rates were 96 percent for households, 94 percent for women, and 86 percent for men.

This report presents the key findings of the NFHS-4 survey in Andhra Pradesh, followed by detailed tables and an appendix on sampling errors. Trends are not included in this state report because previous NFHS surveys did not include estimates for the new state of Andhra Pradesh. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Household composition

More than 3 in 10 of Andhra Pradesh's households (31%) are in urban areas. On average, households in Andhra Pradesh are comprised of 4 members. Fifteen percent of households are headed by women, with 11 percent of the population living in female-headed households.

The vast majority of households in Andhra Pradesh have household heads who are Hindu (85%). Eight percent of households have household heads who are Muslim and the same percentage have heads who are Christian.

Less than one-quarter (20%) of households in Andhra Pradesh have household heads who belong to a scheduled caste, half of household heads belong to an other backward class (OBC), and a small proportion (5%) belong to a scheduled tribe. One-quarter of Andhra Pradesh's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

Less than one-quarter (24%) of Andhra Pradesh's population is under age 15; only 8 percent is age 65 and over. The overall sex ratio of the population is 1,020 females per 1,000 males, and the sex ratio of the population under seven years of age is lower (only 874 females per 1,000 males). Ninety-five percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 6 percent have experienced the death of one or both parents. In all, 88 percent of children below 18 years of age live with both parents, 8 percent live with one parent (mostly with their mother), and the remaining 4 percent live with neither parent. Births of a large majority of children under five years of age (83%) were registered with the civil authorities, and 71 percent of children have a birth certificate.

Housing characteristics

More than three-quarters (82%) of households in Andhra Pradesh live in a *pucca* house and almost all households (99%) have electricity. More than one-third (39%) of households do not use a sanitation facility, which means that household members practice open defecation. Open defecation is more common among rural households (51%) than urban households (11%).

Less than one-fourth (21%) of households in Andhra Pradesh have water piped into their dwelling, yard, or plot.

Seventy-three percent of households use an improved source of drinking water, but only 21 percent have water piped into their dwelling, yard, or plot. Urban households (36%) are more likely than rural households (14%) to have water piped into their dwelling, yard, or plot. Twenty-two percent of households treat their drinking water to make it potable (mostly by straining the water through cloth, by boiling the water, or by using a ceramic, sand, or other water filter). Sixty-two percent of households use a clean fuel for cooking.

Selected household possessions

Eighty-nine percent of households in Andhra Pradesh have a mobile phone. Ninety-four percent of households have a bank or post office account. BPL cards are held by 87 percent of households. Agricultural land is owned by 39 percent of rural households and 9 percent of urban households. Overall, less than one-third (30%) of all households in Andhra Pradesh own agricultural land.

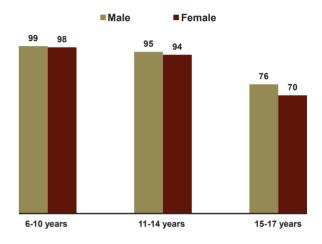

EDUCATION

School attendance among children

Almost 90 percent of children age 6-17 years in Andhra Pradesh attend school (89% in urban areas and 86% in rural areas). School attendance is almost universal (95%) at age 6-14 years, and then drops to 73 percent at ages 15-17. There is almost no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, only 70 percent of girls compared with 76 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

Literacy, educational attainment and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 63 percent of women age 15-49 and 79 percent of men age 15-49 are literate.

Only 18 percent of women age 15-49 in Andhra Pradesh have completed 12 or more years of schooling, compared with 31 percent of men.

Thirty-three percent of women and 17 percent of men age 15-49 have never been to school. Only 18 percent of women age 15-49 in Andhra Pradesh have completed 12 or more years of schooling, compared with 31 percent of men.

Media exposure is high among women and men in Andhra Pradesh. About 9 in 10 women and men watch television at least once a week. However, men (60%) are much more likely than women (28%) to read a newspaper or magazine at least once a week. Only 4 percent of men and 7 percent of women are not regularly exposed to print media or other forms of media.

FERTILITY

Age at first marriage

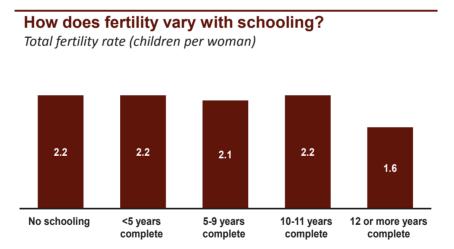

The median age at first marriage is 18.1 years among women age 20-49 years and 24.3 years among men age 25-49 years. On average, men get married more than six years later than women. One-third of women age 20-24 years got married before the legal minimum age of 18. Sixteen percent of men age 25-29 years got married before the legal minimum age of 21.

Fertility levels

The total fertility rate (TFR) in Andhra Pradesh is 1.8 children per woman, implying that the state has reached below replacement level fertility.

Fertility in urban areas, at 1.5 children per woman, is well below replacement level and is also below replacement level even in rural areas (2.0 children per woman). Among births in the three years preceding the survey, only 3 percent were of birth order four or higher.

The greatest differentials in fertility are by schooling. At current fertility rates, women with no schooling will have 0.6 children more than women who had 12 or more years of schooling (a TFR of 2.2, compared with 1.6). Similarly, Muslim women will have an average of about 0.2 children more than Hindu and Christian women (a TFR of 2.0, compared with 1.8).

Pregnancy outcome

Ninety-three percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 7 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage and abortion are the most commonly reported types of foetal wastage, each accounting for 3 percent of all pregnancies.

A majority of the abortions were performed in the private health sector (78%) and 17 percent were performed in the public health sector. Twelve percent of women reporting an abortion, reported having complications from the abortion.

Teenage pregnancy

Among young women age 15-19 in Andhra Pradesh, 12 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child. Very few women age 15 years (0.4%) have started childbearing, but this proportion increases sharply to 19 percent among women who are 18 years old and to 29 percent among women who are 19 years old. Young women who had no schooling are more than six times as likely to have begun childbearing as young women with 12 or more years of schooling.

Birth intervals

The median interval between births in the five years before the survey in Andhra Pradesh is 28.8 months. Twelve percent of births take place within 18 months of the last birth and 33 percent occur within 24 months. Two-thirds of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

Two-thirds of births in Andhra Pradesh occur within three years of the

previous birth.

Fertility preferences

Seventy-six percent of currently married women and 79 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 24 percent of women and 18 percent of men would like to wait at least two years before the next birth. Eighty-eight percent of women and 87 percent of men consider the ideal family size to be two or fewer children.

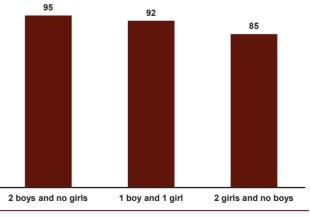

In Andhra Pradesh there is a strong preference for sons. Ten percent of women and 11 percent of men want more sons than daughters, but only 3-4 percent of women and men want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

Women's desire for more children is only slightly affected by their current number of sons. For example, among women with two children, 95 percent with two sons and 92 percent with one son want no more children, compared with 85 percent with two daughters who want no more children.

How does son preference affect women's desire for children?

_ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _

Current family size

In Andhra Pradesh, unplanned pregnancies are not uncommon. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.6 children per woman, instead of the current level of 1.8 children per woman.

FAMILY PLANNING

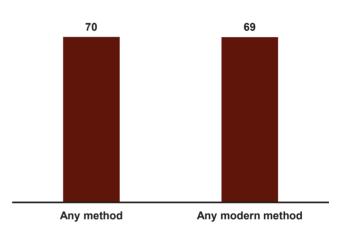

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Andhra Pradesh. However, some methods are still less well known. Only 60 percent of currently married women know about injectables and 14 percent know about female condoms. Among all women, 19 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 70 percent and modern method use is 69 percent. Notably, female sterilization accounts for 98 percent of contraceptive method use. Contraceptive use in NFHS-4 increases sharply with age from 5 percent for women age 15-19 to 83-84 percent for women age 30-49.

In Andhra Pradesh, contraceptive use is only slightly higher in rural areas (70%) than in urban areas (68%). Contraceptive prevalence varies greatly by the level of schooling, ranging from 80 percent of

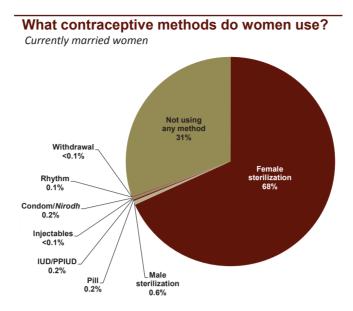

currently married women with no schooling or less than 5 years of schooling to only 47 percent of those with 12 or more years of schooling. Muslim women (62%) are much less likely to use contraception than Hindu women (70%) and Christian women (72%).

Women in Andhra Pradesh are more likely to use contraception if they already have a son. For example, among women with two children, 89 percent with at least one son use a method of family planning, compared with 82 percent of women with two daughters and no sons.

The contraceptive prevalence rate among currently married women age 15-49 is 70 percent. The share of female sterilization in contraceptive use is 98 percent.

_ _ _ _ _

The use of spacing methods is very low (less than 1% of currently married women) in Andhra Pradesh.

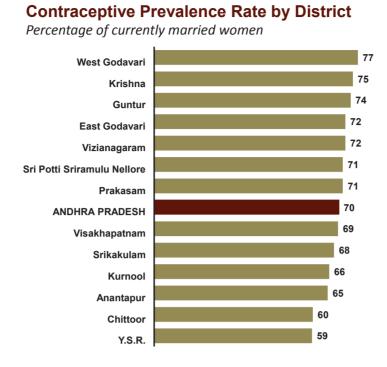

More than three-fourths (76%) of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital followed by CHC/rural hospital/Block PHC and PHC/Additional PHC.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only slightly more than one-third (35%) of users of female sterilization, pills, and IUDs/PPIUDs were ever told by a health or family planning worker about other methods they could use. Only one-fourth were told about the possible side effects or problems with their method, and even fewer (22%) were told what to do if they experienced any side effects.

Men's attitudes

Less than half of (46%) of men in Andhra Pradesh agree that contraception is women's business and a man should not have to worry about it. However, 47 percent think that women using contraception may become promiscuous. A little more than half of men (51%) know that a condom, if used correctly, protects against pregnancy most of the time.

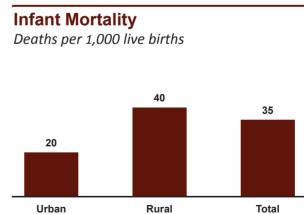

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 5 percent of currently married women have an unmet need for family planning. Currently, 94 percent of the demand for family planning is being satisfied and the same proportion of the demand is being satisfied by modern methods.

INFANT AND CHILD MORTALITY

The infant mortality rate in Andhra Pradesh in NFHS-4 is estimated at 35 deaths before the age of one year per 1,000 live births. The under-five mortality rate for Andhra Pradesh is 41 deaths per 1,000 live births.

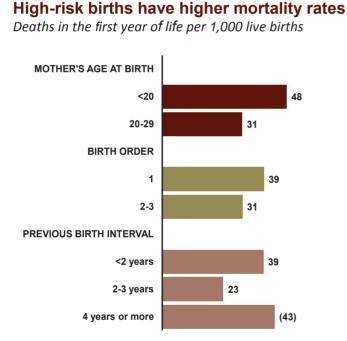

As expected, boys have a slightly higher mortality rate than girls during the neonatal period (in the first month of life). Girls and boys have almost the same mortality rates between ages 1 and 5 years.

Children born to mothers under age 20 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 48 per 1,000 live births for teenage mothers compared with 31 per 1,000 live births for mothers age 20-29. Having children too close together is also risky. Children born less than two years after a previous birth are more likely to die in infancy as children whose mothers waited two to three years between births.

Infant mortality rates are higher for those who are not from scheduled castes, scheduled tribes, or other backward classes (41 per 1,000 live births) than for those who are from other backward classes (29 per 1,000 live births) or scheduled castes (33 per 1,000 live births).

The infant mortality rate is twice as high in rural areas than in urban areas. The infant mortality rate is much higher for children whose mothers have no schooling (42 per 1,000 live births) than for children whose mothers have completed 10 or more years of schooling (26 per 1,000 live births).

Children born less than two years after a previous birth are more likely to die in infancy as children whose mothers waited two to three years between births.

Note: Categories "Mother's age at birth 30-39 and 40-49" and "birth order 4 or more" are not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death.

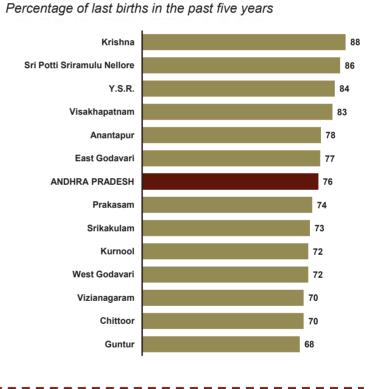

MATERNAL HEALTH

Antenatal care

Among mothers who gave birth in the five years preceding the survey, 97 percent received antenatal care (ANC) for their last birth from a health professional (91% from a doctor and 7% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). One percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, 95 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 93 percent received a Mother and Child Protection Card (MCP Card).

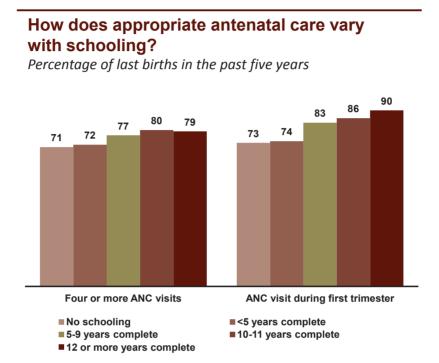

Eighty-two percent of women received antenatal care during the first trimester of pregnancy, as is recommended. A little more than three-fourths (76%) of mothers had four or more

antenatal care visits. Muslim women were more likely to receive four or more antenatal care visits than Hindu or Christian women. The proportion of women who received four or more antenatal care visits is higher for women belonging to scheduled castes, other backward classes, and those who are not from scheduled castes, scheduled tribes, or other backward classes than it is for scheduled tribe women. For 91 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 56 percent consumed them for the recommended 100 days or more. Ninetyfive percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. One-fifth of mothers took an intestinal parasite drug during pregnancy.

Four or More Antenatal Care Visits by District

A little more than three-fourths (76%) of mothers in Andhra Pradesh received at least four antenatal care visits for their last birth. Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least four-fifths received advice on each of the five different areas (95% received advice on breastfeeding, 91% on the importance of institutional delivery, 92% on keeping the baby warm, 80% on family planning and 79% on cord care).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. However, in Andhra Pradesh, at least 98 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken, having their abdomen examined and blood pressure measured, having a urine sample taken, and having a blood sample taken.

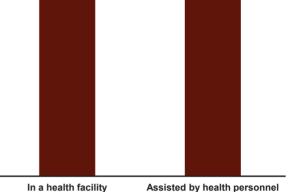

An ultrasound test was performed during 92 percent of pregnancies in the five years preceding the survey. Women from scheduled tribes were much less likely to have an ultrasound test (79%) than those who were not from scheduled castes, scheduled tribes and other backward classes (94%).

Delivery care

Ninety-two percent of births take place in a health facility (mostly a private facility) and only 8 percent take place at home. Institutional births are more common among women who have 10 or more years of schooling and women who are having their first birth.

For 98 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 67 percent of deliveries. Seventy-eight percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

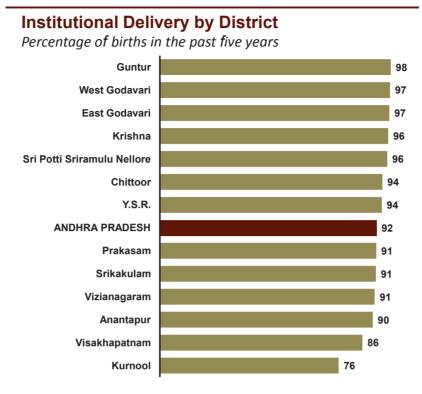

Ninety-two percent of births during the past five years took place with assistance from a skilled provider, and another 3 percent were delivered by a traditional birth attendant.

Forty percent of births during the past five years were delivered by caesarean section. Thirtysix percent of caesarean sections (15% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 17 percent received financial assistance under the *Janani Suraksha Yojana* (JSY) for their most recent birth. Rural women were more likely than urban women to receive financial assistance under JSY. Scheduled caste women were more likely than women from any other caste/tribe group to receive financial assistance under JSY. Women with no schooling were more likely than women with at least 12 years of schooling to receive financial assistance under JSY. Christian women were much more likely to receive financial assistance under JSY than women from any other group.

Ninety-two percent of children in Andhra Pradesh who were born in the past five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Andhra Pradesh, 86 percent of mothers had a postnatal check after their last birth and 81 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 84 percent of births in public health facilities and 83 percent of births in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with only 43 percent of home births.

Only 29 percent of last births in the five years preceding the survey received a health check in the first two days after birth. Surprisingly, 33 percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Ninety-nine percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Seventy-three percent of men with a child under three years said they were present during at least one antenatal check received by the child's mother (79% in urban areas and 70% in rural areas),but only 45 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 31-47percent of men were told about the signs of specific pregnancy complications (vaginal bleeding, convulsions, high blood pressure, prolonged labour, and severe abdominal pain).

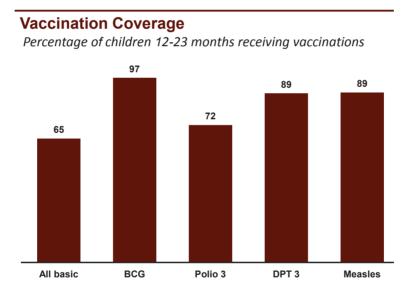

Most fathers with a childless than three years of age were given information about various aspects of maternal care. Eighty-five percent were told about the importance of proper nutrition for the mother during pregnancy and 67 percent were told about the importance of delivering the baby in a health facility. Fifty-eight percent were told about family planning or delaying the next child by a health provider or a health worker.

CHILD HEALTH

Vaccination of children

Less than two-thirds (65%) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, most children are at least partially vaccinated; only 2 percent have not received any vaccinations at all.

Ninety-seven percent of children have received a BCG vaccination. Eighty-nine percent of children received the recommended doses of DPT and measles vaccine. However, only 72 percent received at least the recommended three doses of polio vaccine. There is considerable dropout between the first and third doses of polio vaccine (from 95% to 72%), much higher than the dropout between the first and third doses of DPT vaccine (from 97% to 89%).

Coverage with all basic vaccinations is higher for female children (69%) than male children (61%). Coverage with all basic vaccinations is also higher for rural children than for urban children. It varies inconsistently by mother's schooling. There is not much difference in vaccination coverage by caste/tribe or birth order.

Coverage with all basic vaccinations is higher for female children than male children.

Childhood illnesses

In the two weeks before the survey, less than 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related).

Eight percent of children under age five were reported to have had fever in the two weeks preceding the survey; 77 percent of these children were taken to a health facility or health provider for treatment.

Overall, 7 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-three percent of these children were taken to a health facility or health provider. Ninety-four percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 48 percent of children with diarrhoea were given ORS. Fifteen percent of children with diarrhoea were given gruel and a little more than half (54%) were given some type of oral rehydration therapy (ORT). Thirty percent were given zinc supplements. Twenty-one percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Andhra Pradesh only 6 percent of children with diarrhoea received more to drink than normal. Only about two-fifths of children (39%) received the same amount to drink as usual. Of greater concern, a little more than half of children (56%) with diarrhoea were given less to drink or nothing at all to drink. Only 37 percent of children with diarrhoea were given the same amount of food or more food, as recommended. More than one-third (38%) of children with diarrhoea were given ORT and continued feeding.

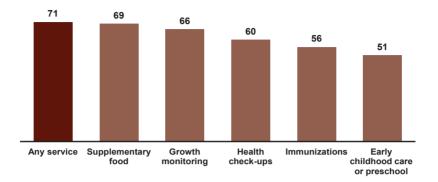

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Seventy-one percent of children under 6 years receive services of some kind from an *anganwadi* centre. The most common services that age-eligible children receive are supplementary food (69%), growth monitoring (66%), and health check-ups (60%). The services that are least likely to be accessed are immunization (56%) and early childhood care or preschool (51%). Seventy-three percent of the mothers of children who were weighed at an *anganwadi* centre received counselling from an *anganwadi* worker or an ANM. Among children under 6 years, slightly more than four-fifths of their mothers received any service from an *anganwadi* centre during pregnancy or while breastfeeding (81-82%).

How many children received *anganwadi* centre services?

Percentage of age-eligible children receiving services

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Andhra Pradesh, only 70 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Seventy-nine percent are put to the breast within the first day of life, but only 39 percent started breastfeeding in the first hour of life (as recommended). While breastfeeding is widespread, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly, because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, a little less than one-fourth (23%) of children are given something other than breastmilk during the first three days. Overall, 82 percent of children continue breastfeeding at 1 year and 54 percent continue breastfeeding at 2 years. The median duration of breastfeeding is 22.9 months, which is the age to which half of children are breastfeed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months just over half (54%) of children in Andhra Pradesh receive breastmilk and complementary foods.

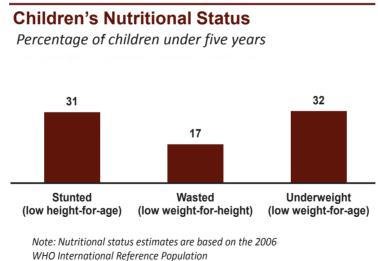

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Less than one-third (32%)of children age 6-23 months are fed the recommended minimum number of times per day and even fewer (23%) are fed from the appropriate number of food groups. Only 8 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Andhra Pradesh, 72 percent of children age 9-59 months were given a vitamin A supplement in the past six months, but only 45 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Twenty-eight percent of children age 9-23 months ate iron-rich foods during the day or night before the survey. Twenty-seven percent of children age 6-59 months were given iron supplements in the week before the survey. Twenty-one percent of children age 6-59 months were given deworming medication in the last six months.

Children's nutritional status

Almost one-third (31%) of children under age five years are stunted or too short for their age, which indicates that they have been undernourished for some time. Seventeen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 5 percent are severely wasted. Thirty-two percent are underweight, which takes into account both chronic and acute undernutrition. One percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 9 percent of children are stunted, 20 percent are underweight, and 30 percent are wasted.

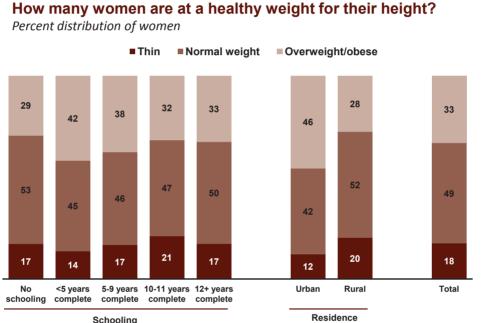

There are only small differences in the level of undernutrition by urban-rural residence or by the sex of the child. However, differences are more pronounced for some of the other background characteristics. Undernutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth.

Adults' nutritional status

About half (51%) of women and men (48%) are either too thin or overweight or obese. More men and women are overweight or obese than thin. Fifteen percent of men and 18 percent of women in Andhra Pradesh are too thin, and 34 percent of men and 33 percent of women are overweight or obese. About half of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, in rural areas, and among the scheduled tribes. Overweight and obesity are most prevalent in older adults, those in urban areas, and Muslims.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. More than 80 percent of Andhra Pradesh's households were using iodized salt at the time of the survey.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, prenatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Andhra Pradesh, especially among women and children.

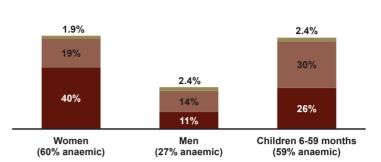

Among children between the ages of 6 and 59 months, a large majority 59 percent are anaemic. This includes 26 percent who are mildly anaemic, 30 percent who are moderately anaemic, and 2 percent who suffer from severe anaemia. Girls are slightly more likely than boys to have anaemia.

Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Half of children (51%) are anaemic even if their mother has 12 or more years of schooling.

Sixty percent of women in Andhra Pradesh have anaemia, including 40 percent with mild anaemia, 19 percent with moderate anaemia, and 2 percent

Anaemia among women, men, and children

Severe anaemia Moderate anaemia Mild anaemia

with severe anaemia. Anaemia exceeds 55 percent for every group of women except those who are pregnant. More than one-fourth (27%) of men are anaemic.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

In Andhra Pradesh, 296 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (384 per 100,000) than among women (209per 100,000), and is higher in urban areas (347 per 100,000) than in rural areas (274 per 100,000).

A large majority of respondents have heard of tuberculosis (84% of women and 79% of men), but even among those who have heard of tuberculosis, only 73 percent of women and 75 percent of men know that it is spread through the air by coughing or sneezing. Almost half of women as well as men have misconceptions about how tuberculosis is spread. Overall, 83 percent of women and 88 percent of men know that tuberculosis can be cured, and only 32 percent of women and 43 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 2,392 women age 15-49 and 3,157 men age 15-49 per 100,000 have diabetes. Overall, 2,973 women and 1,574 men per 100,000 suffer from asthma. The prevalence of asthma among women is higher among older age groups, those who are widowed/divorced/separated/deserted, Christian women, and those in urban areas. Goitre or any other thyroid disorder is somewhat more common than asthma among women (3,826 per 100,000 women) and is much more common among women than men. The prevalence of any heart disease is slightly higher among women (1,425 per 100,000) than men (1,353 per 100,000). Among the five diseases, cancer is the least common, with 95 women per 100,000 and 193 men per 100,000 reportedly suffering from cancer.

Blood pressure (hypertension)

Thirteen percent of women age 15-49 in Andhra Pradesh have hypertension, including 8 percent with Stage 1 hypertension, and 2 percent with Stage 2 and 1 percent with Stage 3 hypertension. Sixty-four percent of women have normal blood pressure, including 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is somewhat higher than in women. Eighteen percent of men in Andhra Pradesh have hypertension, including 11 percent with Stage 1 hypertension, 4 percent with Stage 2 hypertension, and 2 percent with Stage 3 hypertension. Forty-one percent of men have normal blood pressure, including 0.2 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension tends to increase with age.

Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Three percent of women age 15-49 in Andhra Pradesh have high blood glucose levels, and 5 percent have very high blood glucose levels. In comparison, 4 percent and 6 percent of men age 15-49 have high and very high blood glucose levels. Older women and men, and women with little or no schooling, have relatively high blood glucose levels.

Health examinations

In Andhra Pradesh, 34 percent of women have ever undergone an examination of the cervix, 5 percent have ever undergone a breast examination, and 13 percent have ever undergone an examination of the oral cavity.

Tobacco and alcohol use

Twenty-seven percent of men, but only 2 percent of women, age 15-49 use some form of tobacco. Men are much more likely to smoke cigarettes (16%) or *bidis* (8%) than to use other types of tobacco. Among men, the use of any form of tobacco is higher in rural areas than in urban areas with *bidis* being especially popular in rural areas. A little over one-third (34%) of men who smoke cigarettes or *bidis* smoked 10 or more cigarettes or *bidis* in the past 24 hours. Men are more likely to drink alcohol (35%) than to use tobacco, and less than 1 percent women say that they drink alcohol. Among men who drink alcohol, two-thirds drink alcohol at least once a week.

Source of health care

The private health sector is the main source of health care for more than three-fifths of both urban and rural households. Household members are more likely to go to private hospitals (33%) than private doctors or clinics (17%).

Health insurance

Seventy-five percent of households in Andhra Pradesh have any kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat more common in rural areas (81%) than in urban areas (61%). In Andhra Pradesh, the State health insurance scheme predominates, accounting for 95 percent of households with any member covered by insurance.

Seventy percent of women age 15-49 and 76 percent of men age 15-49 in Andhra Pradesh are covered by any health scheme or health insurance. More women and men residing in rural areas than in urban areas are covered by any health scheme or health insurance. Health scheme or health insurance coverage is higher among women and men with less schooling or no schooling than among those with 12 or more years of schooling.

HIV/AIDS

Awareness of HIV or AIDS

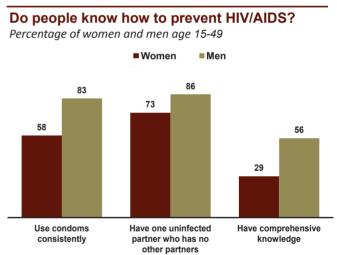

Almost all women (95%) in Andhra Pradesh have heard of HIV or AIDS. In urban areas, 98 percent know about HIV or AIDS, compared with 94 percent in rural areas. Young women age 15-24 years are more likely (97%) than older women age 40-49 (92%) to have heard of HIV or AIDS. Women with no regular media exposure (87%), women having no schooling (90%), and Christian women, and scheduled tribe women (92% each) are less likely than other women to have heard of HIV or AIDS.

Men are only slightly more likely than women to know about HIV or AIDS. Almost all men (97%) in Andhra Pradesh have heard of HIV or AIDS, including 98 percent in urban areas.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, only 58 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 83 percent of men, and seven-tenths (73%) of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 86 percent of men.

Only 29 percent of women and 56 percent of men in Andhra Pradesh have a' comprehensive knowledge' about HIV/AIDS.

This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS.

HIV-related stigma

Around two-thirds (66%) of women and men (69%) in Andhra Pradesh would be willing to take care of a relative with HIV/AIDS in their home. A higher proportion of women (73%) and men (79%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. More than two-thirds of adults say that they would buy fresh vegetables from a shop keeper with HIV/AIDS. Thirty-nine percent of women and 31 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 32 percent of women and 12 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men living in urban areas are slightly more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. More than half (53%) of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Rural women (54%) are more likely than urban women (51%) to have been tested for HIV during ANC.

More than half (53%) of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

_ _ _ _ _ _ _ _

In Andhra Pradesh, men (9%) are somewhat more likely than women (7%) to have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (56% of women, compared with 53% of men).

For more than nine-tenths of adults who received an injection in the past 12 months, a disposable syringe was used.

SEXUAL BEHAVIOUR

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, less than 1 percent of women and 3 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is higher in rural areas than urban areas. Fewer men said that they had multiple sex partners in the past 12 months (2% of men). Less than one percent of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Andhra Pradesh, 56 percent use sanitary napkins, 43 percent use cloth, 12 percent use locally prepared napkins, and 3 percent use tampons. Overall, 68 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 10 years of schooling are more than twice as likely to be using a hygienic method as women with no schooling or less than five years of schooling. Only 59 percent of Muslim women and 67 percent of Hindu women.

Employment and earnings

Only 45 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 84 percent of all men age 15-49 were employed. Among employed women, 94 percent earned cash, including 2 percent whose earnings were in both cash and in-kind and 5 percent were not paid at all. Most men who were employed earned cash (99%) and less than 1 percent were not paid at all. Thirty-six percent of employed women worked in non-agricultural occupations, compared with 61 percent of employed men.

Only 45 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 78 percent decide how their earnings will be used, either alone or jointly with their husbands. Two-fifths (41%) of women who work for cash say that they earn more or about the same as their husbands. By contrast, 94 percent of currently married men whose wives have cash earnings report that they alone or jointly with their wives decide how her earnings are used and 36 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are somewhat less likely to participate in decisions about their own health care (68%) than in decisions about major household purchases and visits to their own family and relatives (72% each). Overall 59 percent of currently married women participate in making all three of these decisions, and 20 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by age, increasing sharply from 32 percent among women age 15-19 to 64 percent among women age 40-49.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were much more likely than women to report that they alone or jointly with their wife participated in both these decisions: 90 percent participated in making decisions about their own health care and 94 percent participated in decisions about major household purchases.

Other indicators of women's empowerment

Twenty-five percent of women have some money that they can decide how to use. The proportion of women with money which they control is higher among urban than rural women, increases sharply with age, and is highest among women who are employed for cash (34%) than any other group of women.

Two-thirds of women have a bank or savings account that they themselves use. This percentage is highest, at 74-76 percent, among women age 30-49. Seventy-one percent of women know of a microcredit programme in the area and 30 percent have ever taken a loan from a microcredit programme.

Two-thirds of women have a bank or savings account that they themselves use.

Only 45 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The groups of women in which relatively fewer women are allowed to go to all three places alone are younger women, women with no living child, women belonging to scheduled castes, and Christian and Muslim women.

Ownership of assets

Forty-three percent of women and 78 percent of men own a house alone or jointly with someone else, and 26 percent of women and 49 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for both women and men.

Forty-three percent of women own a house alone or jointly with someone else, and 26 percent of women own land alone or jointly with someone else.

Thirty-six percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use almost two in three (63%) can read SMS messages. Fifty-four percent of urban women have a mobile phone they themselves use, compared with 28 percent of rural women. Only 23 percent of Christian women have a mobile phone they use, compared with 42 percent of Muslim women and 37 percent of Hindu women. Muslim women who have a mobile phone that they themselves use are less likely to be able to read SMS messages than Christian women and Hindu women who have a mobile phone that they themselves use.

Thirty-six percent of women have a mobile phone that they themselves use.

Gender-role attitudes

Eighty-two percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman neglects the house or children (70%), followed by if she shows disrespect for her in-laws (66%) and if she argues with her husband (46%). Men are less likely to agree: 67 percent say that wife beating is justified in some circumstances, especially if she neglects the house or children (46%), if the husband suspects his wife is unfaithful (44%) or if the wife shows disrespect for in-laws (42%). Even among women and men who have completed at least 12 years of schooling, more than two-thirds (81% of women and 63% of men) say that a husband is justified in beating his wife for one or more of the specified reasons.

Sixty-four percent of women and 71 percent of men believe that a woman is justified in refusing to have sex with her husband if she know she has a sexually transmitted disease, if she know she has intercourse with other women and if she is tired or not in the mood. Most men, 50 percent, do not agree that if a wife refuses to have sex with her husband he has a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

Among women age 15-49, 44 percent have ever experienced physical violence and 6 percent have ever experienced sexual violence. In all, 44 percent of women in Andhra Pradesh have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was the husband.

Forty-four percent of women in Andhra Pradesh have experienced physical or sexual violence.

Violence during pregnancy

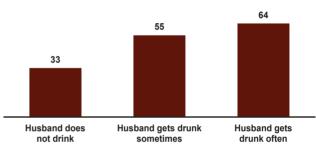

One in 20 women who have ever been pregnant has ever experienced physical violence during one or more of their pregnancies. Christian women, women belonging to scheduled castes, women who were formerly married, and women with no schooling, at 8-11 percent, are more likely than women in any other group to have experienced violence during pregnancy.

Spousal violence

Thirty-eight percent of ever-married women report having been slapped by their husband; 13-22 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; and 2 percent or less have experienced being choked or burned on purpose and being threatened or attacked with a knife, gun, or any other weapon. Five percent report that their husbands have physically forced them to have sex even when they did not want to and 2 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform. Overall, 43 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Twenty percent report spousal emotional violence. Few ever-married women (8%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, more than 1 in 5 women who have at least 12 years of schooling have experienced physical or sexual spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more than twice as likely to be in abusive marriages themselves. Women whose husbands consume alcohol are much more likely than women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, 33 percent of even

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks alcohol, but never gets drunk" not shown since there are fewer than 25 unweighted cases.

women whose husbands do not drink alcohol have experienced physical or sexual spousal violence.

More than one-fifth (21%) of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence, and among women who have experienced both physical and sexual violence this proportion rises to 42 percent. The most common type of injury is cuts, bruises, or aches.

Help seeking

Only 14 percent of women who have ever experienced physical or sexual violence by anyone have sought help. About four-fifths (79%) of women have neither sought help nor told anyone about the violence. Abused women who have sought help most often seek help from their own families. Only 2 percent of abused women who sought help for the violence sought help from the police.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Andhra Pradesh, 2015-16

	Resid	lence	_
Result	Urban	Rural	Total

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

² Protected dug well, protected spring, rainwater, community RO plant

³ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water

⁴ Total may add to more than 100.0 because households may use more than one method of purification

⁵ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying

⁶ Facilities that would be considered improved if they were not shared by two or more households

⁷ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly lowquality and partly high-quality materials are called *semi-pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

⁸ Electricity, LPG/natural gas, or biogas

⁹ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹⁰ Frequency of smoking by anyone inside the house

Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Andhra Pradesh, 2015-16

Household possessions	Urban	Rural	Total	De jure population

Table 11 Current fertility

Age-specific and total fertility rates and crude k	ɔirth
rates by residence, Andhra Pradesh, 2015-16	

Age	Urban	Rural	Total
15-19	0.057	0.094	0.083
20-24	0.147	0.200	0.184
25-29	0.076	0.075	0.075
30-34	0.021	0.018	0.019
35-39	0.004	0.004	0.004
40-44	0.001	0.000	0.000
45-49	0.000	0.000	0.000
TFR (15-49)	1.53	1.96	1.83
CBR	13.9	17.0	16.1

Note: Rates are for the period 1-36 months preceding the survey (approximately 2013-15). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation. TFR = Total fertility rate, expressed per woman CBR = Crude birth rate, expressed per 1,000 population

Table 12 Fertility by background characteristics

Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate, by background characteristics, Andhra Pradesh, 2015-16

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning. DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Ummet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing allogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant with a mistimed pregnant, not using contraception. Women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following a unwented birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and either do not want to "other" religions, who are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for spacing and unmet need for spacing and unmet need for limiting. Total includes women belonging to "other" religions, who are not shown separately. ¹ Total demand is the sum of ummet need divided by total demand ³ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other methods include teres	virrespond to t1 and, USA. West Godavari	3.4	1.8	1.6	609
Y.S.R.	5.5	3.4	2.0	464
Andhra Pradesh	4.6	3.1	1.5	8,044

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome

at the time of the survey of the proportion of births by months since birth. Includes children living and deceased at the time of the survey. It is assumed that children not currently living Median durations are based on the distribution with the mother are not currently breastfeeding.

² Either exclusively breastfed or received breastmilk and plain water and/or non-milk liquids only

Food groups are: a. infant formula, milk other than breastmilk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d.

other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, ghee, or butter Receiving solid or semi-solid food at least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months

Includes two or more feedings of commercial infant formula, fresh, tinned and powdered animal milk, and yogurt

Non-breastfed children age 6-23 months are considered to be fed with a minimum standard of three Infant and Young Child Feeding Practices if they receive other milk or milk products at least twice a day, receive the minimum meal

frequency, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 4 and 6.

Table 65 Prevalence of anaemia in children-Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Andhra Pradesh, 2015-16

	Anaemia s	tatus by haemoglo	bin level		
Background characteristic	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)	Any anaemia (<11.0 g/dl)	Number of children
Child's living arrangements					
Living with both parents	26.2	30.1	2.5	58.7	1,883
Living with one or neither parent	27.6	28.4	1.8	57.8	282
Mother's anaemia status ⁴					
Not anaemic	26.1	23.5	1.6	51.1	842
Mildly anaemic	26.0	32.8	2.8	61.6	822
Moderately/severely anaemic	27.6	36.3	3.0	66.9	414
Total	26.4	29.9	2.4	58.6	2,165

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children of birth order 6 or more, children belonging to "other" religions, children whose caste/tribe is not known, children whose mothers were not interviewed but were in the household, and children whose mother's interview status is not known, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

 2 For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Includes children whose mothers are deceased

⁴ Mildly anaemic is classified as 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known

Andhra Pradesh	58.6	2,165	60.0	9,555	17.6	33.2	9,374

Note: Table is based on children/women who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude (and smoking status for women) using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The Body Mass Index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters (kg/m²).

¹ For pregnant women, the value is <11.0 g/dl

² Excludes pregnant women and women with a birth in the preceding 2 months

Total includes women whose husbands drink alcohol but never get drunk and women who are older than their husbands or are of the same age, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

() Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence

Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Andhra Pradesh, 2015-16

		Percent	age of women wh	o have had:		_
Type of spousal violence experienced	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	Number of ever-married women
Function and a baseling to be and						
Experienced physical violence ¹	18.7	3.1	3.9	2.2	21.2	418
In the past 12 months	17.5	3.3	4.6	2.8	20.8	331

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where y represents the total sample value for variable y, and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1-f}{x^{2}} \sum_{h=1}^{H} \left[\frac{m_{h}}{m_{h}-1} \left(\sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and $z_h = y_h - rx_h$

Where hrepresents the stratum, which varies from 1 to H, m_h is the total number of clusters selected in the h^{th} stratum, y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} fis the overall sampling fraction, which is so small that it

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Andhra Pradesh, there were 494 clusters. Hence, 494 replications were created. The variance of a rate r is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)}\sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

 $r_i = kr - (k-1)r_{(i)}$

where

r is the estimate computed from the full sample of 494 clusters, $r_{(i)}$ is the estimate computed from the reduced sample of 493 clusters (*i*th cluster excluded), and

k is the total number of clusters.

is ignored.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Andhra Pradesh as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Variable	Estimate	Base population
v anabic	HOUSEHO	
lains on improved course of disking water		
Jsing an improved source of drinking water Jsing an improved sanitation facility	Proportion Proportion	Households Households
Using iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages
	WOMEN	
No schooling (Females age 6 years and above)	Proportion	De facto household population of females age 6 and above
Jrban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married gauna not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
